Learning:

Update weights to reduce error next time!

HOW?

Weights update rules

Weights Delta = Error × slope × input

How much we will update
the weights for next time

Error = Target - Estimation

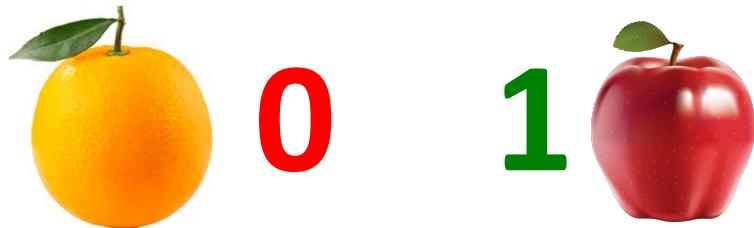

Target

Look at errors closer

Error = Target - Estimation

Target

Three cases:

- Error < 0: Target is 0, estimation is not 0
- Error > 0: Target is 1, estimation is not 1
- Error = 0: Estimation correct

Look at errors closer
(assume inputs are positive)

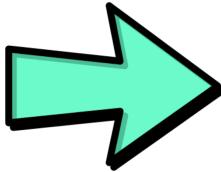

Cases 1:

- Error < 0: Target is **0**, estimation is not 0
